Easy recovery disk volumes. Change in haematological and lipid parameters in patients with type 2 diabetes mellitus on lipid-lowering therapy. Patients with type 2 diabetes mellitus (T2DM) often present with one or more cardiovascular (CV) risk factors. There is a paucity of data examining lipid-lowering therapy (LLT) in patients with T2DM and CV risk factors. This study sought to investigate the haematological and lipid parameters of patients with CV risk factors on LLT in a Middle Eastern population. A cross-sectional, observational study was conducted to compare the haematological and lipid profile parameters of patients receiving LLT for CV risk factors with those not receiving such therapy. A total of 148 patients with at least one CV risk factor were recruited. Of these, the study group consisted of 80 (54.1%) patients on LLT while the control group consisted of 68 (45.9%) patients not on LLT. 82138339de
