If you are really interested, feel free to have a look at the features table. You can also download a sample of JMS Toolkit running on Glassfish 3.1 [here] Q: What's the difference between the Apache Axis toolkit and Axis2? I'm looking for a Java-based web service framework that is well-suited for distributed computing. EclipseLink is the only framework I've come across that is actively being developed and used in production. EclipseLink is very easy to use and I've had good results from it. This is a serious contender for my needs. However, in a previous question, I discussed limitations in EclipseLink I'd discovered with my own authentication mechanism for distributed applications. An immediate solution to my problems would be to use Apache Axis2, which EclipseLink uses under the covers. However, I can't find many introductory materials (such as the documentation on the Apache website) that explain how to use Apache Axis. (The documentation mentions that it's not a recommended solution for distributed computing, which makes me wonder whether I need to use Apache Axis instead of Apache Axis2.) To be honest, I'm very new to web services and distributed computing. I don't know if I'm mistaken, but it seems like Apache Axis2 is being developed entirely out in the open, so the public must have used it to accomplish some of their work. Apache Axis sounds great, but is it worth the cost? The last time I used an open source framework, we lost money because we had to use a patched version of the framework due to a bug. Is the same thing going to happen here? Is the public partial to Apache Axis or Apache Axis2? If so, who or what about Apache Axis2 is winning over Apache Axis? I'm interested in what people in the community think about this. A:

JmsToolkit is a set of tools to help manage and view queues on a JMS server. All the tools in JmsToolkit suite are highly configurable, have small footprint and offer good performance when they are used. Overview JmsToolkit is a fully featured application. The queue viewer is a tiny but powerful tool that offers full functionality with no configuration needed, the remote interface tool opens a connection to an application server and sends a request, then waits for the response from it, it also offers an high level of control over the application, the remote viewer is based on the JMS RemoteViewer Some of its features include : View Messages : shows a list of messages ordered by date, time or number of bytes Sort messages : sort messages by any property when the first message is selected and by message content when you select a specific message Load queue : load a queue either by browsing or by directory loading Load and show a queue : load a queue from a directory or a file Delete queue : delete a queue Save queue : save a queue with multiple messages to either a file, to a directory or to a queue Create new queue : create a new queue and assign permissions to messages More details in the official site At the moment the remote tool supports the Sun JMS Server 4.1, GlassFish 1.1 and Microsoft MSMQ but you can make it support any other JMS servers such as JCA, TIBCO, IBM MQ, XA, ActiveMQ or Apache MQ. The remote viewer is very simple to use and is very intuitive, you only need to input the URL of the server to connect to, the credentials of the server and the queue to display. Having a look at the source code will offer you more details on how the tool works. A: You can use JBossMQ (free) or Apache QPID (commercial). Both would do a similar thing. If you want to use MQTT that supports passing MQTT messages from server to client you could use Q (commercial) There are also messages passing frameworks that can be used, such as Rodman, as others have pointed out.
