Aside from the usual Lightroom- Photoshop integration, the update provides more editing power for the Mac platform and more features for boosting your mobile creativity. Rest assured, no Android app is in sight. This is a point I have spoken to many people about. Nor will it ever be, since they all support the same legacy software (or have their own apps and plugins). The new version of the photo editor Adobe Photoshop, the latest version of the company's flagship tool announced in July, brought a host of new features, some of which are more useful to some users than others. Highlights include a new layer type, Free Transform; Refine Edge and Replace Color tools; improvements to the AI-assisted Content-Aware Fill tool; and integration with Facebook Messenger for live chat, and Apple's Notes and Reminders apps. Smooth, adaptive contrast and sharpening are now applied across a photo's entire canvas, and historical settings are available when rotating a photo in Photoshop. The most exciting change in Adobe Photoshop for me was the deeper integration between the camera and Photoshop. I find that I'm shooting quite a bit more now—and definitely when traveling—and I'm finding it much more useful to have the camera group features baked into the app. I could manipulate the photos before I shift them to the iPad, and then make adjustments in Photoshop before I post to the cloud for sharing. Creative Cloud for iPad and Photoshop offer all the great tools you'd expect from a full-featured desktop version of Photoshop. Creating a new document, you'll get automatic object recognition, autocorrect (which adjusts the brightness, contrast, hue, and saturation of the subject for a better look), and content-aware fill. You also get a pathfinder feature that allows you to simply drag an area, rather than drawing it out on the canvas, and a new clone tool that lets you duplicate objects, plus transform, move, and scale each clone.

Once you are finished you can save the group as one large image. It is advantageous to save the images as separate files for several purposes: To save space on your hard drive. To use as sprites in CSS and JavaScript. To insert as images in an HTML document. To embed them in your website. To update them by using a script or URL and to name them. Depending on your purpose you can use the following options to save your sprite: Choose all the layers and then click on the little plus icon and select the group from there. Then choose the new group name. You then need to make sure that you lock the little scroll bar in the top right hand side to keep it fixed in place. And then you click on the lock little icon of the layer to lock the position. When you want to apply a color, use color as the basis for a guide, or completely change the hue, saturation, or intensity, you can quickly adjust each slider or use manual settings to create your ideal look. Adobe Photoshop has always provided plenty of features for new users, but for those with existing libraries of content, the updates to the Content Browser should make it easier to organize your content and access the work you need. Your content is being treated as a series of folders, which are easy to navigate with the new browser. To try it out, we've made a few changes to the way your Content Browser displays your files and folders. For example, notice that your folders are now named based on their content. You can look through all the content you own with a quick filter to see the files that interest you, no matter where they are stored. To quickly get to a folder, no matter where it is in your Documents bucket, simply select it and you'll see it on the right side of the screen alongside your other folders. The most important change in the updated Content Browser is that all content is now displayed in folders. This rapid organization of content inside of Photoshop should make it easier to find the right content and make it simpler to view, manage, and organize your content as you work.
