After thoroughly investigating each version of this great JPEG editor and admired its features, I have to say there is still a lot of room for improvement. Of course, it's not perfect. It lacks crucial features like a spot healing tool that would enable the user to remove complete objects even more easily. While it has a wide selection of brushes, it does not support layer styles or a Tint adjustment. Nevertheless we have to recognize that Photoshop is still one of the most powerful photo editor to date. Because of it effects like the marbling filter you can create everything like this in very easy steps. Many new features have been added to the Brush panel. Tools work as they do in older Photoshop versions; some are new twists on existing tools, and others are supersets of existing tools (see however, the 3- Point Refinement tool). Blend modes have been implemented where you apply a solid color over a grainy layer of a layer mask, creating a halftone effect. New adjustments include Film, Black/White, CGCRT (Colored plus Grayscale + Red/Green/Blue), and Lomo. The Develop module has about 30 brush and tool adjustments. There are some limitations, though - a brush can be resized only by a single pixel, and the 25 most recently used tools can only be used in Basic mode. Affected Dreamweaver Developers: If you are a Dreamweaver/Flash developer and are considering becoming a Lightroom photoshop CC user, consider this while you are considering your decision: Lightroom can only read Adobe Flash Professional 5.5 or above, while Dreamweaver can read Adobe Photoshop Professional CS3 or above, and Adobe Contribute 5.5 or above. Lightroom also blocks access to the "Draw" command which enables you to draw on images, which is something I would consider a sort of "web-design" tool.
