Sometimes you'd like to scribble on a layout to illustrate a description or idea, and you want to make that idea visually accessible in a document without having to grab the mouse and start clicking around. In Photoshop's Latest Labs, Adobe has added a scribble panel with feature as a texture layer in the Layers panel (a similar feature is called an annotation feature) so you can draw in the graphic form and build from there. You can also right-click on the scribble feature and choose Color to change the color and other options and then there's a Columns drop-down so you can add and rearrange the scribbles in a grouping.

And in a big change, Photoshop CC now also has a UI for pen-cased tablets, and -ki is coming to Photoshop. I'm a big fan of this change—you don't know what UI to expect when you get a new system, so I like knowing you'll be dealing with the same interface on all systems. The Small Business app and support for a more unified interface on Windows tablets made this one of the more welcome new features of Photoshop CC. Some of the changes made in this version are a direct result of user response. For example, a feature called "Show in Browser" which displays images in the home screen of your image browser, as well as an enhanced Color Matching feature that significantly improved the shooter color accuracy. Another change is the new way that Adobe removes the XMP data embedded in a RAW file. The Photoshop team decided to move away from XMP as a method of file organization. This change means that the dialog box that asks you to compress the data embeds some new data in addition to removing XMP altogether.
